ProSIP® Total Assurance Monitoring

Continuous performance monitoring of your network

ProSIP® network traffic analysis and monitoring services provide unparalleled insight into network performance and usage.

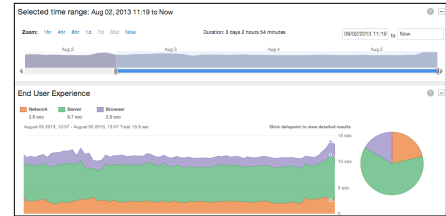

The ProSIP® Total Assurance Monitoring solution provides 24/7 performance monitoring of your network. ProSIP® TAM provides detailed insight into how your network is used by your team – which devices are using the most bandwidth, accessing social media, streaming content and much more. ProSIP® TAM also includes customizable alerts for changes to network traffic and a monthly analysis and performance report by a certified ProSIP® Network Engineer.

Intelligent Web Application Performance Monitoring

Web applications are critical to modern businesses and ProSIP® TAM provides you with actionable performance insight for any web application internally developed or run by a 3rd party service provider.

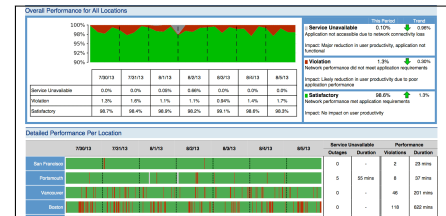

- ProSIP® TAM uses synthetic transactions to perform the same actions as real users providing actionable end user experience insight.
- ProSIP® TAM Global component offers multiple distributed cloud data centers to give you the perspective of global internet users.
- Know if the network is holding back web app performance and what you need to do to fix it, fast.

Application-aware Traffic Analysis

BYOD and cloud based services make knowing which devices, applications and users are consuming network resources – in real time - more critical than ever before. Unlike traditional network traffic analysis and flow analysis tools, FlowView’s application awareness feature analyzes network and application traffic with deep, detailed granularity. FlowView gives you this insight in the fastest and easiest-to-deploy solution on any network.

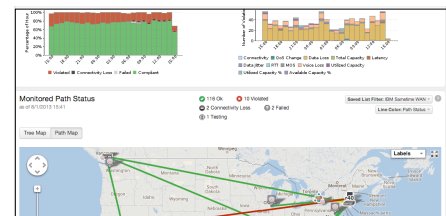

- Deep Application Intelligence technology automatically identifies the applications in use and sources of network activity and bandwidth consumption like streaming media.
- ProSIP® TAM is the fastest and easiest way to understand which applications are in use on any network independent of the hardware or configuration in place.
- ProSIP® TAM uses the latest technology including Big Data to give you the best of both worlds - fast analysis and long term reporting.

Active Network Performance Monitoring

ProSIP® TAM is a truly unique network performance monitoring solution, measuring the actual network performance over any network to any IP-Addressable end point. With one extremely light-weight solution, you can measure the performance of your internal network; over your WiFi to local servers; over VPN to remote offices; and over the Internet to Web applications and cloud services.

- ProSIP® TAM’s continuous stream of performance insight is compared against your application-specific SLAs, so you will know exactly when network performance impacts your application performance.
- Universal Visibility - Active network performance insight across 3rd party networks to devices you don’t own including SaaS or Cloud services.
- SLA Validation – Real-time comparison of performance against required performance thresholds of applications or carrier SLAs.
- Continuously find and fix problems fast – QoS validation, SNMP polling and advanced diagnostics quickly pinpoint issues like latency and jitter.

ProSIP® network traffic analysis and monitoring services provide unparalleled insight into network performance and usage.
